# MIDSOUTH VENEER INDUSTRIES, 1972

*Daniel F. Bertelson*

In 1972 the Midsouth States harvested 2.3 billion board feet (International 1/4-inch rule) of veneer logs. Softwood output, mainly pine, rose to 2.1 billion feet, and hardwood dropped to 162 million board feet. The 101 veneer plants (fig. 1) in the region processed a total of 2.2 billion board feet.

Veneer manufacturing, once important to the South as a hardwood industry, has now become an important softwood industry. Through 1963 the Midsouth produced only hardwood veneer.

Today the region processes mostly pine. This change resulted from the introduction and expansion of southern pine plywood plants. The first such mill became operational in December 1963. Since then plywood production has grown into one of the major industries in the Midsouth, and the hardwood veneer industry has declined in both volume processed and number of plants.

This report is based on a 100-percent canvass of veneer mills in operation in 1972. The names and locations of these plants are given in tables

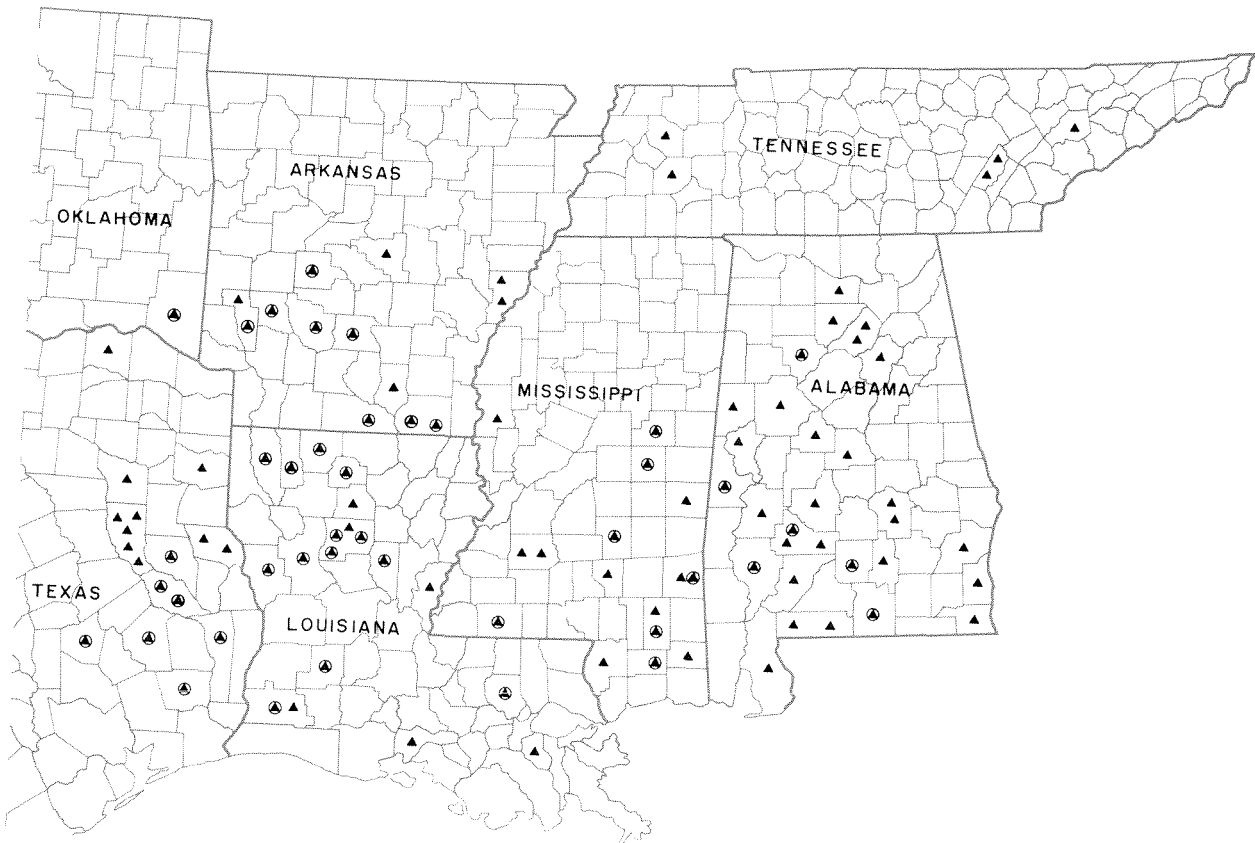

Figure 1.—*Location of Midsouth veneer plants, 1972. Triangles indicate hardwood veneer plants; circled triangles indicate southern pine veneer plants.*

6 through 12. To assess trends in the veneer industry, log production and receipts were compared with data from studies in 1963<sup>1</sup> and 1969<sup>2</sup>.

## Hardwood Veneer

Midsouth forests supplied 162 million board feet of hardwood veneer logs in 1972, some 25 percent less than in 1969. During the same period the number of hardwood veneer plants decreased by 27 percent; only 59 remain in operation.

Hardwood veneer plants are classified as container or standard plants. The 35 container plants, which manufacture veneer for boxes, baskets, and hampers, processed 50 percent of hardwood logs peeled in the Midsouth. These plants can use logs of smaller diameter and poorer quality than those processed by standard veneer plants. The number of container mills was reduced by nine in the last 3 years. Standard plants, once the major consumer of hardwood veneer logs, manufacture veneer for furniture, doors, and woodenware. The number of standard mills has dropped from 37 to 24 since 1969.

The species distribution of hardwood veneer logs harvested in the Midsouth changed markedly in the last decade (fig. 2). In 1963, soft-textured species such as sweetgum, tupelo, cottonwood, and yellow-poplar, made up 85 percent of the hardwood output. In 1972, they accounted for only 63 percent. The decline is due to shortages of timber in the size desired rather than a change in the species preference of manufac-

2 Sternitzke, H. S. **Midsouth veneer log production.** USDA For. Serv. Resour. Bull. SO-25, 9 p. South. For. Exp. Stn., New Orleans, La. 1971.

Figure 2.—Hardwood veneer log output by species, 1972.

turers. Oak accounted for more than half the volume from firm-textured species; pecan was second in volume. In the past few years these woods have had a wider acceptance by the furniture industry.

Alabama leads the Midsouth in the production of hardwood veneer logs (fig. 3) and in mill receipts. Mississippi is a distant second in both categories; Texas is third. Oklahoma, which has no hardwood veneer plant, increased its log output by 18 percent since 1969. In all other Midsouth States, hardwood veneer log harvests declined. Texas had the largest percentage reduction at 39 percent; Alabama fell the most in volume.

Figure 3.—Veneer log output by State, 1972.

In the past the Midsouth has been a net importer of hardwood logs for veneer manufacturing. But in 1972 the region exported over 12 million board feet to plants in nine States in the North and East and imported 6.5 million board feet from five States, Africa, and South America. These figures represent a slight increase in exports and a 73 percent decrease in imports since 1969. The largest decrease in imports was in foreign logs.

## Softwood Veneer

In 1963 only 2 percent of the Midsouth's veneer log output was pine. By 1969 more than 80 percent was pine, and in 1972 pine accounted for 93 percent of the region's veneer harvest.

Some 2.1 billion board feet of pine veneer logs was produced in 1972. Production has increased 89 percent since 1969, and it is 525 times greater than the 1963 harvest of 4 million board feet. The Midsouth supplied virtually all the softwood veneer logs processed in the region; less than 0.5 million board feet was imported from Florida.

The Midsouth States also exported almost 38 million board feet to Georgia and Florida.

Over 99 percent of the pine veneer logs produced in the Midsouth was made into certified softwood plywood meeting designated nationwide commercial standards. The rest was processed at hardwood veneer plants, mostly container mills, or used as inlays at standard mills.

The Nation's softwood plywood industry produced a record 18.3 billion square feet ( $\frac{3}{8}$ -inch basis) of plywood in 1972. It is estimated that the Midsouth contributed more than one-fifth of the national output. Five of the top eight softwood plywood producing States were located in the Midsouth, and Louisiana passed California to become the third largest producer of plywood in the United States.

The 42 pine plywood plants in the Midsouth

processed an average of 49 million board feet each. The number of plants ranged from 13 in Louisiana to one in Oklahoma. Tennessee, which is dominated by hardwood forests, is the only Midsouth State without a pine plywood plant.

### **Veneer Residues**

The veneer plants in the Midsouth generated 171 million cubic feet of wood residues in 1972. Coarse residues such as cores and cull pieces suitable for conversion into pulp chips accounted for 96 percent of the volume. Almost 81 percent was actually chipped and used by pulpmills, 3 percent was burned as industrial and domestic fuel, and 12 percent was used in miscellaneous products such as posts, studs, animal bedding, and soil mulch. The remaining 4 percent was waste.

Bertelson, Daniel F.

1974. Midsouth veneer industries, 1972. South. For.  
Exp. Stn., New Orleans, La. 11 p. (USDA For.  
Serv. Resour. Bull. SO-47)

The Midsouth harvested 2.3 billion board feet of veneer logs in 1972. Pine logs accounted for 93 percent of the total. Of the 101 active veneer plants in the region, 42 manufactured southern pine plywood.

**Additional keywords:** Plywood, log harvest, log receipts.
